

PADD 5 monthly crude oil stock identity — representative month, July 2023

Values in thousand barrels (kbbbl). EIA stock series from PSM and weekly W41.

Item	Source	kbbbl	Notes
Commercial stocks — PADD 5 (EIA total)	EIA MCRSTP51	55,800	Reported published value
Named tank-farm: Los Angeles	operator filings	18,200	
Named tank-farm: San Francisco Bay	operator filings	14,500	
Named tank-farm: Puget Sound	operator filings	8,700	
Other named PADD-5 points	operator filings	8,500	
SPR allocated to PADD 5	EIA SPR table	0	All SPR sites are on Gulf Coast
Sum of named points	computed	49,900	
Implied gap (EIA total – named sum)	computed	5,900	≈ 6 mmbbl — where does this go?

The published PADD-5 total exceeds the sum of every commercial point the analyst can name by about 6 million barrels every single month. No row in this sheet accounts for the gap; the balance does not close.

PADD 5 stock identity with manual adjustment — same month, after analyst patch

The 6,000 kbbl is dropped into an unallocated row so the totals reconcile.

Item	Source	kbbl	Notes
Commercial stocks — PADD 5 (EIA total)	EIA MCRSTP51	55,800	Reported published value
Named tank-farm: Los Angeles	operator filings	18,200	
Named tank-farm: San Francisco Bay	operator filings	14,500	
Named tank-farm: Puget Sound	operator filings	8,700	
Other named PADD-5 points	operator filings	8,500	
SPR allocated to PADD 5	EIA SPR table	0	
Unallocated / in transit / other	manual plug	5,900	Set by analyst to close the balance — label varies between workbooks
Sum of decomposed points	computed	55,800	Now matches the EIA total

The balance now closes, but the 5,900 kbbl sit in an opaque row that the next analyst rotating onto the desk will not understand. The framework instead binds this volume to a named in-transit corridor node (pipe_padd3_to_padd5), making the same value queryable and labelled at the schema level.
