

PADD 3 monthly crude oil balance — July 2017 (pre-Harvey)

Values in thousand barrels per day (kbd) except Δ Stocks in kbbl for the month.

Item	Sign	Source	Value
Production	+	EIA MCRFPT3	7,650
Refinery runs	–	EIA WCRRIP32	9,220
Imports	+	EIA MCRIMP32	3,120
Exports	–	EIA MCREXP32	1,010
Movements out to PADD 1	–	EIA MMRMUSP12	95
Movements out to PADD 2	–	EIA MMRMUSP23	475
Δ Stocks for the month (kbbl)	–	EIA MCRSTP31	680
Implied residual (kbd)	B	computed	28

A normal month. The implied residual of +28 kbd is well below 1% of the throughput and is plausibly noise. The analyst leaves it in the adjustment cell unremarked.

PADD 3 monthly crude oil balance — August 2017 (Hurricane Harvey)

Same workbook, next month. ~25% of US refining capacity offline for parts of the month.

Item	Sign	Source	Value
Production	+	EIA MCRFPT3	7,605
Refinery runs	–	EIA WCRRIP32	7,810
Imports	+	EIA MCRIMP32	2,990
Exports	–	EIA MCREXP32	870
Movements out to PADD 1	–	EIA MMRMUSP12	100
Movements out to PADD 2	–	EIA MMRMUSP23	470
ΔStocks for the month (kbbbl)	–	EIA MCRSTP31	9,360
Implied residual (kbd)	B	computed	340

Implied residual jumps to +340 kbd — roughly an order of magnitude above the steady-state median (45 kbd) reported in Table 5.4. In the spreadsheet this number falls into the same unlabelled adjustment cell as the July 2017 noise. The framework instead labels it as B at the PADD 3 node, traceable for any downstream consumer.
