

PADD 2 monthly crude oil balance — EIA-only workbook, representative month

Values in thousand barrels per day (kbd) except Δ Stocks in kbbl for the month.

Item	Sign	Source	Value
Production	+	EIA MCRFPT2	1,530
Refinery runs	–	EIA WCRRIP22	3,840
Imports — total	+	EIA MCRIMP22	2,640
Exports	–	EIA MCREXP22	40
Movements from PADD 3 to PADD 2	+	EIA MMRMUSP32	680
Movements to PADD 1	–	EIA MMRMUSP21	45
Movements to PADD 4	–	EIA MMRMUSP24	35
Δ Stocks for the month (kbbl)	–	EIA MCRSTP21	850
Implied residual (kbd)	B	computed	60

Clean workbook. One series per line, one cell per series, residual of +60 kbd absorbs noise. The analyst wants to deepen this by attributing the inter-PADD movements to specific pipelines using daily Genscape data. See the next sheet.

PADD 2 monthly balance — same month, with Genscape pipeline-flow data layered on

Genscape reports daily flow on named lines. Monthly mean shown here; each new column comes with manual subtractions to prevent double-counting.

Item	Sign	Source	Original (kbd)	Adj 1 (kbd)	Adj 2 (kbd)	Net (kbd)	Notes
Production	+	EIA MCRFPT2	1,530			1,530	
Refinery runs	–	EIA WCRRIIP22	3,840			3,840	
Imports — total	+	EIA MCRIMP22	2,640			2,640	
Exports	–	EIA MCREXP22	40			40	
Movements from PADD 3 to PADD 2	+	EIA MMRMUSP32	680	-250	-380	50	Subtract DAPL + Keystone to avoid double-count
↳ DAPL flow (monthly mean)	+	Genscape PipeFlow	0	+250		250	Added Bakken inflow; partially overlaps with EIA
↳ Keystone flow	+	Genscape PipeFlow	0	+380		380	Added Canadian inflow; overlaps with EIA imports — re-check
↳ Spearhead flow (out to Cushing)	–	Genscape PipeFlow	0	+90		90	Cushing-outbound; sign convention manual
↳ Residual / un-named pipelines	+	manual plug	0	+60		60	≈9% of capacity Genscape doesn't cover; recomputed monthly
Movements to PADD 1	–	EIA MMRMUSP21	45			45	
Movements to PADD 4	–	EIA MMRMUSP24	35			35	
ΔStocks for the month (kbbl)	–	EIA MCRSTP21	850			850	
Implied residual (kbd) — original	B	computed before Genscape	60			60	
Implied residual (kbd) — with Genscape	B	computed after Genscape				-45	Should be ≈60 if integration is clean; gap signals a reconciliation problem
Σ Genscape named pipelines vs EIA inter-PADD	check	computed				40	Genscape sum exceeds EIA aggregate — analyst must investigate

Every Genscape line costs the analyst three things: a new column, a manual subtraction from the EIA inter-PADD column to prevent double-counting, and a sign-convention decision. The residual-pipelines column for the 9% Genscape doesn't cover has to be recomputed each month. The cross-check at the bottom (ΣGenscape vs EIA aggregate) is the only protection against silent drift, and it has to be hand-coded. In the framework, Genscape values TS-bind to the named pipeline node and EIA aggregates bind to the PADD-view node; v_aggregation_consistency does the cross-check by construction.
